GuardScale

Observe → Inspect → Recommend → Approve → Protect → Verify

AWS architecture · bounded agent tools · human-approved response

Operational foundation

IAM task roles · Secrets Manager · CloudWatch logs · GitHub Actions · Versioned images and artifacts · Reviewed CloudFormation change sets

Safety boundary: AI recommends; an authorized human approves. The host revalidates scope and expiry. No arbitrary remote shell.

Protection outcomes distinguish requested, applied, removed and expired states. Continued traffic permits renewal only within configured limits.

Source architecture, not deployment certification. Bedrock and messaging require configuration; SES inbound replies require live receiving verification.
